

The Ultimate Gear Oil!

A NEW GENERATION FULL SYNTHETIC GEAR OIL DEVELOPED USING THE LATEST IN ENHANCED SYNTHETIC POLYMER FRICTION MODIFIERS AND BASE STOCK.

The original formula was developed to address a problem with special turbine drive units where constant high loads and speeds would destroy even the best synthetic gear lubricants. The manufacturer was failing to provide a satisfactory service life of the gear units with failures occurring around 300 hours, less in high temperature applications, with total replacement of the gear drive unit the only option.

Since releasing this new generation of oil in 2001, new developments in Synthetic polymer technology have enabled us to further improve the load carrying capabilities and service life to a point where this lubricant is now supplied to several major manufacturers for applications including mining drive gear units, marine winch units and several heavy duty gear units used in various crane applications in the construction industry.

The performance data of this oil is not available as the original and ongoing development is funded by at least one of the companies we have supplied for several years. These companies do not wish to own and restrict it's use to their applications only but do wish to stop poor substitutes finding their way into the equipment they service.

This oil is a Genuine Full Synthetic SAE 90 with a performance specification in excess of GL5. The load carrying test results clearly indicate this formula does work and as such our clients see no reason to conform to the types of specification levels they had used previously.

Should further information be required on this or any other special blend oils we have please contact
